Engineering firm secures Scandinavian order

A UK company which designs and installs recycling equipment has won its second major order from a company in Scandinavia.

The 6 tonne-per-hour baler is the second commissioned by Swedish firm Ragn-Sells from Glastonbury-based Middleton Engineering

Middleton Engineering, based in Glastonbury, Somerset, has been commissioned by Swedish recycling firm Ragn-Sells to build a new cardboard baler with the capacity to process 6 tonnes an hour. The machine will be exported to the Ragn-Sells' Danish recycling facility in Copenhagen.

This is the second deal Ragn Sells have done with Middleton Engineering, after ordering a modified baler in June last year.

Middleton Engineering's managing director Ashley Middleton, said: "It's great to be able to export British technology and have such prestigious companies coming to us for the quality of our products. All our balers are designed and built in the UK to endure, typically lasting over 20 years, and our expert refurbishment service means they can live to bale again – often for another 10 years."
